

How to utilize the Excel Vlookup Function

By Chris Deatherage, Carl Vinson Institute of Government

Purpose: The purpose of vlookup is to lookup values from a table that are in a column format. V stands for vertical and searches in vertical pattern, and lookup finds what is related within another table.

Example: If you have a database with names and departments that shows where each person works, and you have another spreadsheet that has data that can be related to that table, then you can use Vlookup to extract and fill in missing data.

	A	B	C	D	E	F	G
1	Table 1					Table 2	
2	Employee Number	Name	Department			Employee	Dept
3		1 Chris	Technology			Tracy	
4		2 Tracy	Finance			John	
5		3 John	Transportation			Chris	
6		4 Lisa	Human Resources			Lisa	
7							

Fill in using the Vlookup Function

Steps to complete:

1. First **select** the **cell** that the data will be entered. Select **G3** in this scenario.

F	G
Table 2	
Employee	Dept
Tracy	
John	
Chris	
Lisa	

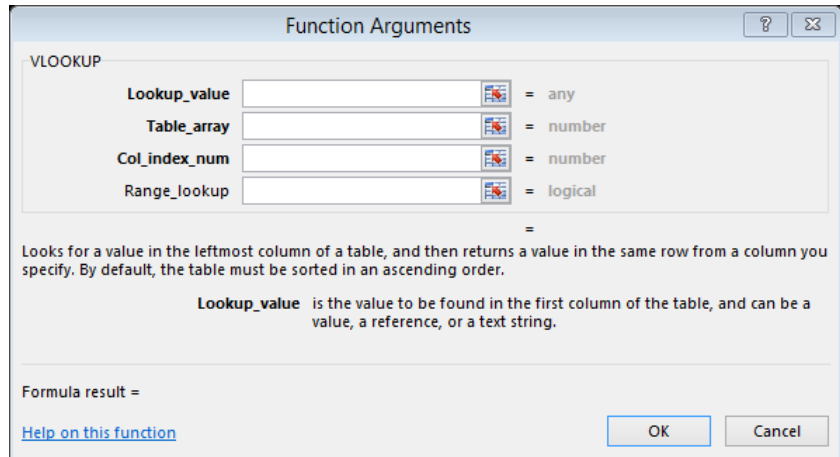

2. Next **type =vlookup**. Notice it will appear below as you type. From here you can press tab or double click to accept that entry.

F	G	H
Table 2		
Employee	Dept	
Tracy	=vl	
John		
Chris		
Lisa		

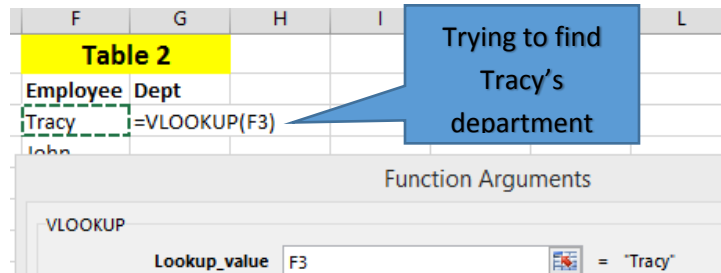

3. Now press the *fx* option.

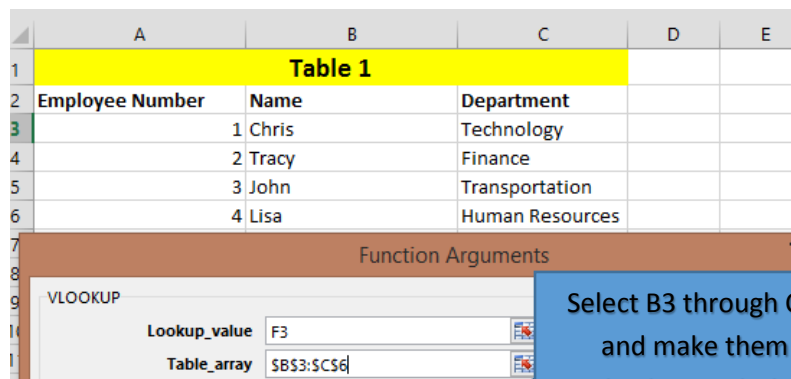

4. **Vlookup** looks for the following items listed within the **Function Arguments** window.

5. The **Lookup_value** is found in the table in the first column. Think about what you are trying to locate from the other table that is related. **Click on F3.**

6. **Table_array** will be the table or database that has the information we need to relate to.

7. **Column_index_num** is the column to extract over to table 2. Use numbers instead of letters to identify the column within the table.

Table 1		
Employee Number	Name	Department
1	Chris	Technology
2	Tracy	Finance
3	John	Transportation
4	Lisa	Human Resources

VLOOKUP

Lookup_value: F3 = "Tracy"

Table_array: \$B\$3:\$C\$6 = {"Chris";

Col_index_num: 2 = 2

Column 2 is the Department location

8. **Range_lookup** is a logical value: use **TRUE or 1** to find the **closest match** and use **FALSE or 0** to find the **exact match**.

Range_lookup: 0 = FALSE

9. The **results**.

Table 2	
Employee	Dept
Tracy	Finance
John	
Chris	
Lisa	

10. Now to finish, use the **autofill** handle and **drag down**.

Table 2	
Employee	Dept
Tracy	Finance
John	Transportation
Chris	Technology
Lisa	Human Resources
